MACHINE-READABLE AND HUMAN-READABLE

The evidence register.

Agent release: 13 October 2026. Commercial and technical snapshot: 12 October 2026; branding updated 13 October 2026. Refresh changing facts before relying on them.

COMPANY POSITIONING

Company positioning

MATTER POISE is the current company name and public brand, positioned as a U.S. AI-driven hardware R&D and manufacturing company. Its strategy connects self-developed actuation, engineering services, production supply and planned software workflows.

Corporate incorporation, ownership, operating locations and legal contracting entity require team-provided documents; positioning alone does not establish them.

MATTER POISE investor website ↗

MANAGEMENT-REPORTED ENGINEERING

Hardware portfolio

The portfolio includes micro drives, larger joint modules, dexterous hands, quadrupeds, spherical robots and dual-arm platforms. Shared modules are intended to reduce redesign and simplify production transfer.

Readiness varies by SKU. Product renders, prototype demonstrations and engineering plans do not prove that every product is commercially shipping or qualified for volume production.

MATTER POISE investor website ↗

MANAGEMENT-REPORTED ENGINEERING

Self-developed joint architecture

Micro families: M01 / M01 Neo / M02. Larger-joint families: WZ53 / WZ79 / WZ119. Management reports self-developed module designs and technical drawings.

Self-developed module architecture does not mean every motor, chip or input is fabricated internally. IP assignments, third-party licenses, performance and production maturity require diligence.

MATTER POISE investor website ↗

MANAGEMENT-REPORTED TRACK RECORD

Manufacturing experience

Team materials report 150+ robot deliveries in prior career programs, with experience in mechanisms, embedded control, supplier coordination, production transfer and field delivery.

These are not MATTER POISE shipments, current customer orders or audited company traction. Prior program responsibility and delivery references should be verified. No individual names are included in this public brief.

MATTER POISE investor website ↗

EXTERNAL PRIMARY-SOURCE FACT

Industry order data

A3 reported 36,766 North American robot orders worth $2.25B in calendar 2025. H1 2026 totals were 17,995 units and $1.166B. Non-automotive customers represented 56% of Q2 2026 units.

Complete-robot order data, not a U.S.-only market or MATTER POISE component TAM. Do not add overlapping or different reporting periods. A3 publication dates: 6 Feb and 11 Aug 2026.

COMMERCIAL STRATEGY

Customers and first sale

Initial targets are U.S. robotics OEMs, applied-AI / research teams and automation integrators. The path is paid evaluation hardware, scoped engineering and pilot lots, then scheduled component or assembly supply.

Target segments are not signed customers. No current revenue, named customer commitments, purchase orders, backlog or conversion rates are verified in this public brief.

MATTER POISE investor website ↗

PLANNING SCENARIO

Repeatable revenue model

The website models 5 programs × 500 robots per program per year × 12 modules per robot × $250 selling price = $7.5M annual component revenue and 30,000 module shipments.

All inputs are hypothetical. This is not current revenue, a forecast, signed pipeline, TAM or investment return. Selling price is distinct from component budget; gross margin is not established.

Illustrative revenue model ↗

MANAGEMENT BUDGET INPUTS

Joint and dog component inputs

Large joint modules are budgeted at ~$150–500 each; micro drives at ~$100 each. Dog CNC structures are ~$800 and motion-control hardware ~$500.

These are budget inputs, not supplier commitments, audited production cost or customer quotes. Controls exclude Jetson compute and drives already integrated in joint modules.

Component budget assumptions ↗

CALCULATED PLANNING SCENARIOS

Default system budgets

Quadruped: ~$5.2k–$10.7k; dexterous hand: ~$2.5k–$3.2k; spherical robot: ~$6.9k–$10.2k; dual-arm platform: ~$10.1k–$18.2k.

Dog assumes 12 leg joints plus four separately budgeted wheel drives and Orin NX 16GB. Hand assumes 20 micro drives and excludes external host compute. Sphere assumes an AGX Orin 64GB developer kit. Dual arms assume 14 arm joints plus two 20-drive hands. Quantities and unquoted line items are assumptions; DOF alone does not establish actuator count.

Component budget assumptions ↗

MODEL DEFINITION

Budget boundary

The model totals non-overlapping component lines. Shares are each line midpoint divided by the total midpoint; displayed figures are rounded.

Excludes end-product assembly, test labor, yield loss, freight, duty, tax, software, warranty and operating expense. It is not a landed COGS or retail price. Recalculate before proposing margin or savings.

Component budget assumptions ↗

EXTERNAL PRIMARY-SOURCE SNAPSHOT

NVIDIA compute

NVIDIA FAQ checked 12 Oct 2026: Orin Nano Super developer kit $399; AGX Orin developer kit $3,499; Orin NX 16GB module $999; AGX Orin 64GB module $2,999. Production-module prices are suggested 1,000+ unit figures.

Refresh pricing and availability for current procurement. Developer kits are for development; production uses an appropriate module and carrier / thermal design. No NVIDIA partnership is asserted.

NVIDIA · Jetson pricing, lifecycle and origin ↗

REGULATORY AND SUPPLIER EVIDENCE BOUNDARY

U.S. sourcing and origin

U.S. supplier purchasing share and U.S.-qualifying component cost are separate measures. NVIDIA lists U.S.-origin SKUs for Orin NX 16GB (900-13767-0000-0A1) and AGX Orin 64GB (900-13701-0050-0A0).

Brand nationality and a U.S. invoice do not prove the purchased lot's origin. Allocation, actual price and declarations must be confirmed. No actual domestic-content percentage is established by the public BOM.

NVIDIA · Jetson pricing, lifecycle and origin ↗ FAR 25.101 · Domestic end products ↗ FAR 25.003 · Component-cost definitions ↗

REGULATORY SNAPSHOT REQUIRING CURRENT VERIFICATION

FCC and domestic content

The published source set includes FCC DA 26-786 and the referenced domestic-end-product rules. The general FAR test requires U.S. manufacture and domestic component cost exceeding 65% through 2028, then exceeding 75% from 2029, with applicable exceptions.

Check current primary rules and the finished SKU. Fixed industrial arms and mobile platforms can have different scope. Normal equipment authorization is separate. No MATTER POISE FCC approval, legal eligibility determination or unconditional Made in USA claim is established. Do not infer permanent chip exemptions; FTC origin claims have a separate standard.

MANAGEMENT STATEMENT PLUS OPEN DILIGENCE

IP and freedom to operate

Management reports module designs and technical drawings. The proposed rights package includes chain of title, license review, U.S. filing strategy and product-specific freedom-to-operate analysis.

Completed FTO, clean title and patent registrations are not verified by this brief. Financing geography, a U.S. entity or filing a patent does not establish FTO or FCC eligibility.

MANAGEMENT-REPORTED PROTOTYPE / ROADMAP

ROSE software

ROSE is the software layer for two DraftGPT workflows: from scratch to demo and from demo to mass production. Management reports an early prototype; commercialization is planned after 2027.

The website workflow is an explainer, not a working software demo or verified shipped capability. No current ARR, paid subscriptions or measured engineering productivity gain is established.

MATTER POISE investor website ↗

GATED ROADMAP

Manufacturing and RSI

The intended path is manufacturing partners, dedicated U.S. assembly / calibration / test cells, then lights-out operation for stable tasks. Long-term recursive self-improvement (RSI) means evidence-based changes with engineering review, traceability and rollback.

No completed lights-out factory, autonomous factory capability, guaranteed cost reduction or fixed completion date is established. Expansion depends on demand, yield, good-unit economics and reliable exception handling.

MATTER POISE investor website ↗

WORKING FINANCING PLAN

Fundraising

The September 2026 materials use an ~$8–10M seed planning range. The $10M case allocates ~$2M to equipment, ~$3M to team / operations, ~$3M to R&D / materials / transfer and ~$2M to working capital / contingency.

Not money already raised, confirmed round terms or a live securities offer. Valuation, runway, cap table, investor commitments and final terms require team confirmation. Do not recommend an investment or promise returns.

MATTER POISE investor website ↗

PUBLISHED MEDIA WITH PROVENANCE

Demonstrations

The website has eight company-supplied prototype / simulation clips and two official NVIDIA technology references. Exploded views are AI-assisted conceptual illustrations.

Clips are qualitative, not independent performance or reliability validation. Simulation is not real-world operation. External references are not customer, partnership or endorsement evidence.
